

# DESTRUCTION OF THE KONDO CLOUD IN THE GENERALISED SIAM: UNITARY RG PERSPECTIVE

ABHIRUP MUKHERJEE <sup>1</sup>, SIDDHARTHA LAL <sup>1</sup>

<sup>1</sup>DEPARTMENT OF PHYSICAL SCIENCES, IISER KOLKATA

FEBRUARY 18, 2022

# **THE GENERALISED SIAM MODEL**

# THE MODEL

$$H = \sum_{k\sigma} \epsilon_k \tau_{k\sigma} + V \sum_{k\sigma} \left( c_{d\sigma}^\dagger c_{k\sigma} + \text{h.c.} \right) - \frac{1}{2} U (\hat{n}_{d\uparrow} - \hat{n}_{d\downarrow})^2 + J \vec{S}_d \cdot \vec{S} + K \vec{C}_d \cdot \vec{C}$$

supplement 1-particle  
hybridisation with **spin-  
exchange** and **charge  
isospin-exchange**

# THE MODEL

$$H = \sum_{k\sigma} \epsilon_k \tau_{k\sigma} + V \sum_{k\sigma} (c_{d\sigma}^\dagger c_{k\sigma} + \text{h.c.}) - \frac{1}{2} U (\hat{n}_{d\uparrow} - \hat{n}_{d\downarrow})^2 + J \vec{S}_d \cdot \vec{S} + K \vec{C}_d \cdot \vec{C}$$

$$C_d^z = \frac{1}{2} (\hat{n}_d - 1)$$

$$C_d^+ = c_{d\uparrow}^\dagger c_{d\downarrow}^\dagger$$

$$C_d^- = c_{d\downarrow} c_{d\uparrow}$$

# **URG OF GENERALISED SIAM**

# $U > 0$ ( $J > 0, K < 0$ ): FLOW TOWARDS STRONG-COUPPLING

$J \rightarrow \text{AFM}, \quad K \rightarrow \text{FM}$

$$d_0 = \omega - \frac{D}{2} - \frac{U}{2} + \frac{K}{4}, \quad d_1 = \omega - \frac{D}{2} + \frac{U}{2} + \frac{J}{4}, \quad d_2 = \omega - \frac{D}{2} + \frac{J}{4}, \quad d_3 = \omega - \frac{D}{2} + \frac{K}{4}$$

$$\Delta V = \frac{3n_j V J}{8} \left( \frac{1}{|d_2|} + \frac{1}{|d_1|} \right) > 0$$

$$\Delta J = \frac{n_j J^2}{|d_2|} > 0$$

$$\Delta |K| = -\frac{n_j K^2}{|d_3|} < 0$$

**( $K$  is irrelevant)**

# $U > 0$ ( $J > 0, K < 0$ ): FLOW TOWARDS STRONG-COUPPLING

$J \rightarrow \text{AFM}, \quad K \rightarrow \text{FM}$

$$\Delta U = 4V^2 n_j \left( \frac{1}{d_1} - \frac{1}{d_0} \right) - n_j \frac{J^2}{d_2}$$

$V > J$

$V < J$

# $U > 0$ FIXED POINT HAMILTONIAN

$$H^* = \sum_{k < k^*, \sigma} \epsilon_k \hat{n}_{k\sigma} + \frac{U^*}{2} (\hat{n}_{d\uparrow} - \hat{n}_{d\downarrow})^2 + J^* \vec{S}_d \cdot \vec{S}_<$$

$$+ V^* \sum_{k < k^*, \sigma} (c_{d\sigma}^\dagger c_{k\sigma} + \text{h.c.})$$

$$\vec{S}_< = \frac{1}{2} \sum_{k, k' < k^*} c_{k\alpha}^\dagger \vec{\sigma}_{\alpha\beta} c_{k',\beta}$$

# **ZERO-BANDWIDTH LIMIT OF FIXED POINT HAMILTONIAN**

# ZERO-BANDWIDTH LIMIT OF FIXED POINT HAMILTONIAN

## Route to the zero-bandwidth model

At strong-coupling fixed point,

- kinetic energy acts as a perturbation
- **compress the bandwidth to just the Fermi surface**

$$H_{\text{zero bw}}^* = (\epsilon_F - \mu) \hat{n}_{k_F} + \frac{U^*}{2} (\hat{n}_{d\uparrow} - \hat{n}_{d\downarrow})^2 + V^* \sum_{\sigma} \left( c_{d\sigma}^{\dagger} c_{0\sigma} + \text{h.c.} \right) + J \vec{S}_d \cdot \vec{S}_0$$

**(center of motion)**

- Setting  $\mu = \epsilon_F$  gives a **two-site model**

$$H_{\text{zero}}^* = \frac{U^*}{2} (\hat{n}_{d\uparrow} - \hat{n}_{d\downarrow})^2 + V^* \sum_{\sigma} \left( c_{d\sigma}^{\dagger} c_{0\sigma} + \text{h.c.} \right) + J \vec{S}_d \cdot \vec{S}_0$$

# ZERO-BANDWIDTH LIMIT OF FIXED POINT HAMILTONIAN

## Effective two-site problem

$$|\Psi\rangle_{\text{gs}} = \frac{c_s}{\sqrt{2}} (|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle) + \frac{\sqrt{1 - c_s^2}}{\sqrt{2}} (|2, 0\rangle + |0, 2\rangle), \quad c_s \rightarrow 1 \text{ as } D \rightarrow \infty$$

# **LOCAL FERMION LIQUID EXCITATIONS**

# LOCAL FERMI LIQUID EXCITATIONS

## Effective Hamiltonian in singlet subspace

We treat the dispersion as a **real-space nearest neighbour hopping**.

$$\begin{aligned} H^* = & -\frac{U}{2} (\hat{n}_{d\uparrow} - \hat{n}_{d\downarrow})^2 + J^* \vec{S}_d \cdot \vec{S}_o \\ & + V \sum_{\sigma} (c_{d\sigma}^{\dagger} c_{o\sigma} + \text{h.c.}) \\ & - t \sum_{i\sigma} (c_{i\sigma}^{\dagger} c_{i+1,\sigma} + \text{h.c.}) \end{aligned}$$

# LOCAL FERMI LIQUID EXCITATIONS

## Effective Hamiltonian in singlet subspace

Initially consider **just the first site**. Treat **hopping as perturbation**:

$$|\Psi\rangle_{GS}^* = c_s |SS\rangle + \sqrt{1 - c_s^2} |CT, 0\rangle$$

$$V = -t \sum_{\sigma} (c_{0\sigma}^{\dagger} c_{1,\sigma} + \text{h.c.})$$

## Effective Hamiltonian in singlet subspace

Upto **fourth order**, effective Hamiltonian is

$$H_{\text{eff}}^* = \text{constant} + \alpha \mathcal{P}_{\text{charge}}$$

$\mathcal{P}_{\text{charge}} \longrightarrow$  projector onto  $\hat{n}_1 \neq 1$

- For  $U \ll V \ll J$ , we get  $0 < \alpha \ll 1$
- a **very weak local FL** on 1<sup>st</sup> site

## **SIGNATURES OF BREAKDOWN OF SCREENING – JOURNEY TOWARDS LOCAL MOMENT PHASE**

- We will work with a Hilbert space of  $(6+1=)$  **7 sites**
- **Recreate RG flow** by tuning the parameters  $U, V, J$
- **Observe various measures** of entanglement and correlation along this variation

# BREAKDOWN OF RENORMALISED PERTURBATION THEORY

## Perturbation parameter, zero mode gap and local FL strength

**closing of gap,**

breakdown of p. theory,

extremely **correlated** LFL

# DESTRUCTION OF KONDO CLOUD

## Mutual information within the Kondo cloud

- loss of spin-flip scattering and **disappearance of Kondo cloud**

# DESTRUCTION OF KONDO CLOUD

## Many-particle correlations in $k$ -space

- loss of entanglement within the K cloud, **breakdown of screening**

# DECOUPLING OF IMPURITY SITE FROM LATTICE

## Mutual information in real space

- $d$  and  $o$  disentangle,  $o$  gets entangled with the lattice

# DECOUPLING OF IMPURITY SITE FROM LATTICE

## Impurity entanglement entropy

■ impurity site **disentangles from the lattice**

# DECOUPLING OF IMPURITY SITE FROM LATTICE

## Real space spin-spin correlations

- impurity **spin compensation vanishes** (loss of screening)
- Spin correlation between 0 and 1 increases

# DECOUPLING OF IMPURITY SITE FROM LATTICE

## Real space diagonal and off-diagonal correlations

- Correlations between 0 and 1 increase
- Result of tight-binding hopping **breaking the singlet**

# DECOUPLING OF IMPURITY SITE FROM LATTICE

## Variation of real-space correlations with distance

- Correlations **fall off with distance**
- Even sites are AFM in correlation, odd sites are FM

# VARIATION OF IMPURITY SPECTRAL FUNCTION

# WHAT'S HAPPENING?

$J, V \gg U, t$  : weak LFL

$U \gg J, V \sim t$  : highly correlated metal

$U > 0; J, V = 0$  : insulator

## AUXILIARY MODEL $\rightarrow$ BULK

- At large  $J, V$ , we have **large overlapping** Kondo clouds (gray regions)
- As we go towards the local moment phase, the **Kondo clouds shrink**
- At  $V, J \sim 0$ , the Kondo **length scale diverges** and the system becomes insulating

## **DISCUSSIONS & FURTHER WORK**

## DISCUSSIONS & FURTHER WORK

- Rewinding the RG flow shows the **decoupling** of the impurity site.

## DISCUSSIONS & FURTHER WORK

- Rewinding the RG flow shows the **decoupling** of the impurity site.
- When used as an auxiliary model, this a **metal-insulator transition**.

## DISCUSSIONS & FURTHER WORK

- Rewinding the RG flow shows the **decoupling** of the impurity site.
- When used as an auxiliary model, this a **metal-insulator transition**.
- **Stabilising the insulating phase under RG still remains to be done.**

# DISCUSSIONS & FURTHER WORK

- Rewinding the RG flow shows the **decoupling** of the impurity site.
- When used as an auxiliary model, this a **metal-insulator transition**.
- Stabilising the insulating phase under RG **still remains to be done**.
- For this, we will insert a **Hubbard term on the zeroth site**, and check the RG flows.
