The Unitary Renormalization Group Method

The General Idea

- Apply unitary many-body transformations to the Hamiltonian

$$
\begin{array}{c} H_j \\ \Big\downarrow U_j \\ H_{j-1} \end{array}
$$

Mukherjee and Lal 2020a; Mukherjee and Lal 2020b.

The General Idea

- Apply unitary many-body transformations to the Hamiltonian
- Successively decouple high energy states

$$\begin{array}{c} H_j \\ \big\downarrow U_j \\ H_{j-1} \end{array}$$

Mukherjee and Lal 2020a; Mukherjee and Lal 2020b.

Zero-bandwidth limit of fixed point Hamiltonian

Route to the zero-bandwidth model

At strong-coupling fixed point,

- kinetic energy acts as a perturbation
- **compress the bandwidth to just the Fermi surface**

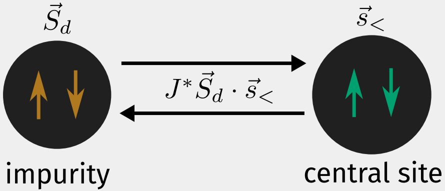
$$H^*_{\text{zero bw}} = J\vec{S}_d \cdot \vec{s}_< + (\epsilon_F - \mu)\,\hat{n}_{k_F} \quad \text{(center of motion)}$$

- Setting $\mu = \epsilon_F$ gives a **two-spin Heisenberg model**

$$H^*_{\text{zero}} = J^*\vec{S}_d \cdot \vec{s}_<$$

Effective two-site problem

$$H^*_{\text{zero}} = J^* \vec{S}_d \cdot \vec{s}_< + H^*_{\text{IOMS}}$$



Singlet ground state: $|\Psi\rangle_{\text{gs}} = \frac{1}{\sqrt{2}} \left(|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle\right) \otimes_{j=j^*}^{N} |n_j\rangle$

Goldhaber-Gordon et al. 1998.

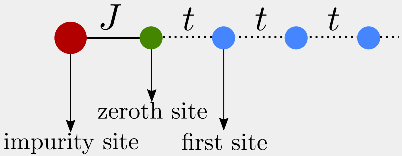
Effective Hamiltonian in singlet subspace

We approximate the dispersion as a **real-space nearest neighbour hopping**:

$$H^* = J^* \vec{S}_d \cdot \vec{s}_< - t \sum_{i\sigma} \left(c^\dagger_{i\sigma} c_{i+1,\sigma} + \text{h.c.} \right)$$

$$t \ll J$$

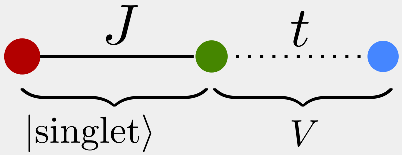


Effective Hamiltonian in singlet subspace

Initially consider **just the first site**. Treat **hopping as perturbation**:

$$|\Psi\rangle_0^* = \frac{1}{\sqrt{2}}\left(|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle\right)$$

$$V = -t\sum_{\sigma}\left(c^{\dagger}_{0\sigma}c_{1,\sigma} + \text{h.c.}\right)$$



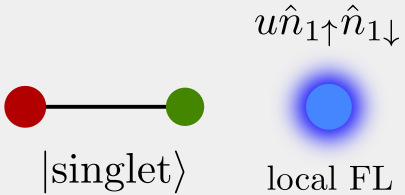
Effective Hamiltonian in singlet subspace

At **fourth order**, effective Hamiltonian is

$$H^*_{\text{eff}} = -\frac{16\alpha t^4}{3J^{*3}}\mathcal{P}_{\text{spin}} + \frac{32\alpha t^4}{3J^{*3}}\mathcal{P}_{\text{charge}}$$

$$\mathcal{P}_{\text{spin}} \longrightarrow \text{projector onto } \hat{n}_1 = 1$$

$$\mathcal{P}_{\text{charge}} \longrightarrow \text{projector onto } \hat{n}_1 \neq 1$$



- charge sector has a **repulsive term**
- so, first site harbours a local FL

Effective Hamiltonian in singlet subspace

On reinstating the **rest of the sites**, the complete effective Hamiltonian is

$$H^*_{\text{eff}} = |\mathcal{C}_{\text{LFL}}|\mathcal{P}_{\text{charge}} - t\sum_{i>0,\sigma}\left(c^\dagger_{i\sigma}c_{i+1,\sigma} + \text{h.c.}\right)$$
